# **Objectives**

You should be able to...

### **Basic Higher Order Functions**

Dr. Mattox Beckman

Illinois Institute of Technology Department of Computer Science

- Define *higher order function* and give some examples.
- Define the foldr and map functions.
- Use foldr and map to implement recursion patters we saw earlier.
- Understand the lambda form and how to use eta-expansion.

Basic Higher Order Functions Objectives First Class Values

# First Class Values

A type is said to be *first class* type when it can be

• assigned to a variable, passed as a parameter, or returned as a result

### Examples:

- APL: scalars, vectors, arrays
- C: scalars, pointers, structures
- C++: like C, but with classes
- Scheme, Lisp, ML: scalars, lists, tuples, functions

The Kind of Data a Program Manipulates Changes the Expressive Ability of a Program

# Compose

### Example

```
_1 double x = x * 2
_{2} inc x = x + 1
3 compose f g x = f (g x)
```

Dr. Mattox Beckman (IIT)

• Running the above code gives us...

Prelude> :t double double :: (Num a) => a -> a Prelude> :t compose compose ::  $(t1 \rightarrow t2) \rightarrow (t \rightarrow t1) \rightarrow t \rightarrow t2$ Prelude> compose inc double 10

◆□▶◆□▶◆□▶◆□▶ ■ から○

Basic Higher Order Functions

21

### Twice

• One handy function allows us to do something twice.

#### Twice

```
1 twice f x = f (f x)
```

Here is a sample run...

```
Prelude> :t twice
twice :: (t -> t) -> t -> t
Prelude> twice inc 5
```

Prelude> twice twice inc 4

Dr. Mattox Beckman (IIT)

• Functions do not have to have names.

These functions are equivalent

Lambda Form

• The two versions of plus are identical as far as the compiler is concerned.

Basic Higher Order Functions Lambda and Eta Interfaces

Door #2

bar (a,b) = a + b

◆□▶◆□▶◆臺▶◆臺▶ 臺 釣魚@

# $\eta$ -expansion

# An Equivalence

$$e \equiv \lambda x.e x$$

Lambda and Eta Anonymous Functions

• Proof, assuming *e* is a function...

$$(\lambda x.e x) z \equiv e z$$

### These are equivalent

Dr. Mattox Beckman (IIT)

 $_2$  plus a = (+) a

So are these

$$_{1}$$
 inc  $x = x + 1$ 

$$_2$$
 inc = (+) 1

$$_3$$
 inc = (+1)

### Two Isomorphic Types

• Notice the difference between these two functions?

foo 
$$ab = a + b$$

Here is a sample run.

Prelude> foo 10 20

30

Prelude> bar (10,20)

Dr. Mattox Beckman (IIT)

30

Prelude> :t bar

bar :: 
$$(Num t) => (t, t) -> t$$

Lambda and Eta Interfaces Lambda and Eta Interfaces

## Curry

# Uncurry

- A function that takes its arguments one at a time is called *curried*.<sup>1</sup>
- This function takes a non-curried function and returns a curried version of it!

```
curry
1 curry f a b = f (a,b)
```

```
Prelude> :t curry
curry :: ((t, t1) -> t2) -> t -> t1 -> t2
Prelude> :t curry bar
curry bar :: (Num t) => t -> t -> t
Prelude> curry bar 10 20
30
```

<sup>1</sup>Named after logician Haskell Curry.

Dr. Mattox Beckman (IIT)

Basic Higher Order Functions

Other Examples

Dr. Mattox Beckman (IIT)

• Look at these and see if you understand what they do.

```
Example 1

1 ntimes 0 f x = x

2 ntimes n f x = f (ntimes (n-1) f x)
```

Basic Higher Order Functions

Lambda and Eta Interfaces

```
Example 2

1 flip f a b = f b a
```

```
Example 3
1 complist [] x = x
2 complist (f:fs) x = f $ complist fs x
```

```
uncurry
1 uncurry f (a,b) = f a b
```

Here is a possible use...

inc = curry plus 1
