#### Objectives

You should be able to...

#### **Tree Traversals**

#### Dr. Mattox Beckman

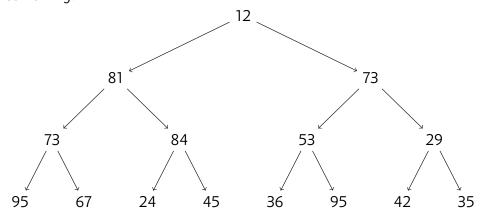

ILLINOIS INSTITUTE OF TECHNOLOGY
DEPARTMENT OF COMPUTER SCIENCE

- ► Know two of the most common tree search patterns:
  - ► Depth First Search
  - ► Breadth First Search
- ► Know five tree traversal algorithms:
  - Preorder
  - Postorder
  - Inorder
  - Next
  - Previous

#### Looking for the Answer to the Ultimate Question

Suppose we have the following binary tree, and we want to search it for something.

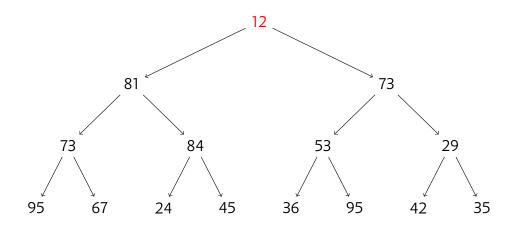

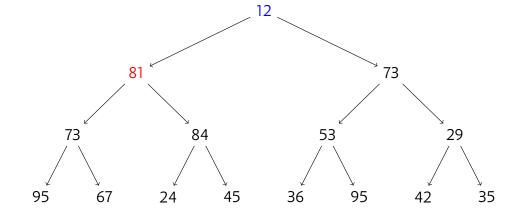

#### Depth First Search

#### **DFS Algorithm**

- ► Check the Current Node
- ► Recursively Search the Left
- ► Recursively Search the Right

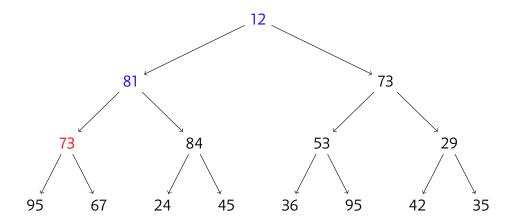

# Searching via DFS

#### Things to know.

#### Pros

- Very easy to write this.
- ► Uses very little memory. (How much?)

#### Cons

- ► Does not handle back-edges well.
- ► Does not handle infinite trees at all.

# A Back Edge

# 73 84 53 29 95 67 24 45 36 95 42 35

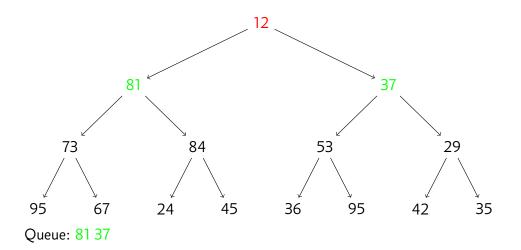

#### Breadth First Search

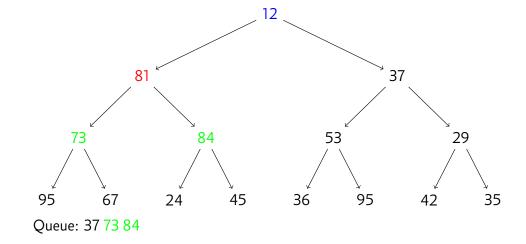

#### BFS Algorithm

- ► Enqueue the Root
- ► Then...
  - ► Dequeue a Node
  - ► Check Node
  - ► Enqueue Children

Introduction

Searching 000000 Traversals

4□ > 4□ > 4 = > 4 = > = 9 < 0</p>

#### Things to know.

#### Pros

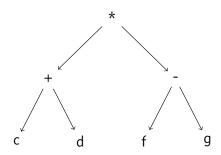

- ► Finds node closest to root.
- ▶ Handles infinite trees and back edges.

#### Cons

- ► Can use a lot of memory. (How much?)
- ► Usually takes a bit longer to write.
- ▶ BFS is also called "level order traversal".

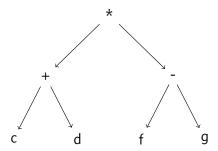

#### Three Kinds

▶ There are three kinds of traversals you should know.

- ► Preorder: \* + c d f g used by Scheme and Lisp
- ► Inorder: c + d \* f g used by scientific calculators
- ► Postorder: c d + f g \* used by Reverse Polish Notation

#### Preorder

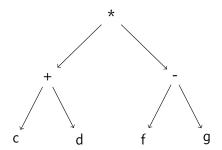

- ► Preorder: \* + c d f g used by Scheme and Lisp
- ► How can you code this traversal scheme?
- ► Note: if you can distinguish leaves from nodes, you can reconstruct the tree from the traversal!

#### Inorder

Introduction

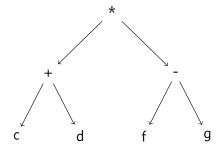

► Inorder: c + d \* f - g — used by scientific calculators

This one is tricky! Consider: can you reconstruct the tree given the string?

#### 

#### Postorder

- ► Postorder: c d + f g \* used by Reverse Polish Notation
- ► How can you code this traversal scheme?
- ► Note: if you can distinguish leaves from nodes, you can reconstruct the tree from the traversal!
