### **Objectives**

You should be able to...

### Regular Languages

Dr. Mattox Beckman

Illinois Institute of Technology Department of Computer Science

- Be able to explain the problem of parsing.
- Know how to recognize a word using an NFA or a DFA.
- Know the difference between a DFA and an NFA
- Be able to convert a NFA into a DFA
- Vocabulary to know: deterministic, nondeterministic, lexing, scanning, accept state, transition.
- Know the syntax of regular expressions.
- Know how to convert between regular expressions and state machines.
- Know the limitations of regular languages.

Regular Languages Parsing 2 / 42

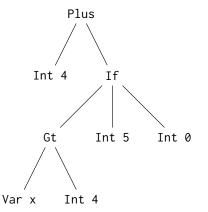

Haskell Version

### The Problem

• Computer programs are entered as a stream of ASCII (usually) characters.

$$4 + if x > 4 then 5 else 0$$

• We want to convert them into an *Abstract Syntax Tree* 

```
PlusExp (IntExp 4)

(IfExp (GtExp (VarExp "x") (IntExp 4))

(IntExp 5)

(IntExp 0))
```

### The Solution

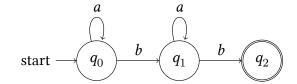

following properties:

5 / 42

- It consists only of the letters a and b.
- The letter b occurs twice, once at the very end.

Suppose I want to teach the computer how to recognize a word with the

• We can use a state machine...

•  $q_0$  is the start state.

**State Machines** 

- The transitions consume a character of input.
- $q_2$  is an accepting state.
  - You can have more than one accepting state.
  - You can have transitions out of an accepting state.

Dr. Mattox Beckman (IIT)

• (a.k.a. tokens)

• Convert the tokens into a *tree*. • This is called *parsing*.

Regular Languages

◆ロト ◆園 ト ◆ 恵 ト ◆ 恵 ・ 夕 Q ○

Dr. Mattox Beckman (IIT)

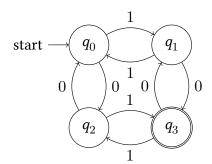

Regular Languages

## Example 1

# • What kind of strings will this state machine accept?

• Start with *characters* and convert them into *words*.

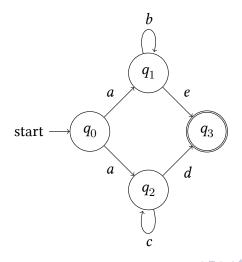

• This is called *lexing*, *scanning*, or *tokenizing*.

### Nondeterminism

State machines can be *nondeterministic* in two ways:

• Way 1: Multiple edges from a state with the same label

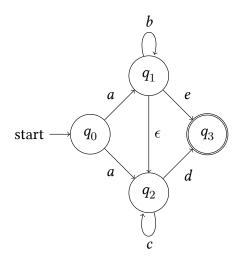

Regular Languages

 $\epsilon$ -closure

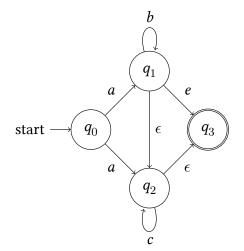

### Nondeterminism

State machines can be *nondeterministic* in two ways:

• Way 2: Have edges that don't consume input.

• The  $\epsilon$ -closure is the set of all states that can be reached by only taking  $\epsilon$ paths.

Dr. Mattox Beckman (IIT)

Regular Languages

## **Using State Machines**

- With the exception of Prolog, computers have a hard time dealing with nondeterministic state machines.
- Solution: we can convert them!

How to do it:

- Add set  $\{q_0\}$  to the queue.
- ② Pop set of states *Q* from the queue. If seen before, discard and go to 1.
- **3** Take the *epsilon closure* of *Q* to get *R*.
- **1** Create a new state named after R. For each input recognized by  $q_R$ , push the resulting set of states onto the queue.

## Example 2

• Start with  $q_0$ . Create a new state  $r_0$  in the new machine.

Dr. Mattox Beckman (IIT) Dr. Mattox Beckman (IIT) Regular Languages Regular Languages

ranslation Translation

# Example 2

# Example 2

• An *a* from set  $q_0$  will go to  $q_1$  and  $q_2$ . So create a state  $r_{1,2}$ .

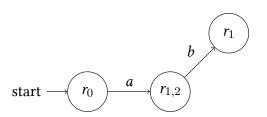

• A *b* from set  $q_1, q_2$  will go to  $q_1$ . So create a state  $r_1$ .

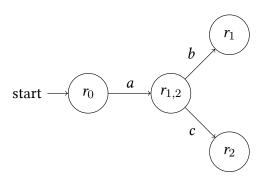

Example 2

# Example 2

• A c from set  $q_1$ ,  $q_2$  will go to  $q_2$ . So create a state  $r_2$ .

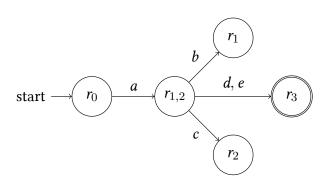

• An *e* or *d* from set  $q_1, q_2$  will go to  $q_3$ . So create a state  $r_3$ .

Dr. Mattox Beckman (III)

Regular Languages

29 / 42

Motivation

- *Regular Languages* were developed by Noam Chomsky in his quest to describe human languages.
- Computer Scientists like them because they are able to describe "words" or "tokens" very easily.

### **Examples:**

Integers a bunch of digits

Reals an integer, a dot, and an integer

Past Tense English Verbs a bunch of letters ending with "ed"

Proper Nouns a bunch of letters, the first of which must be capitalized

Regular Languages

30 / 42

## A bunch of digits?!

- We need something a bit more formal if we want to communicate properly.
- We will use a *pattern* (or a *regular expression*) to represent the kinds of words we want to describe.
- As it will turn out, these expressions will correspond to NFAs.
- Kinds of patterns we will use:
  - Single letters
  - Repetition
  - Grouping
  - Choices

## Single Letters

- To match a single character, just write the character.
- To match the letter "a"...
  - Regular Expression: a
  - State machine:

- To match the character "8"...
  - Regular Expression: 8
  - State machine:

Syntax of Regular Expressions Syntax of Regular Expressions

### Juxtaposition

- To match longer things, just put two regular expressions together.
- To match the character "a" followed by the character "8"...
  - Regular expression: a8
  - State machine:

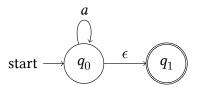

- To match the string "hello"...
  - Regular expression: hello
  - State machine:

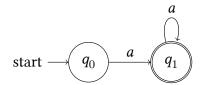

## Repetition

- For zero or more occurrences, add a \*
- For one or more occurrences, add a +
  - Zero or more copies of a...
    - Regular expression a\*
    - State machine:

- One or more copies of a...
  - Regular expression a+
  - State machine:

Dr. Mattox Beckman (IIT)

Regular Languages

Syntax of Regular Expressions

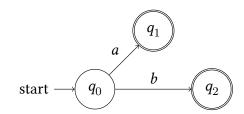

Grouping

- To groups things together, use parenthesis.
- To match one or more copies of the word "hi"...
  - Regular expression: (hi)+
  - State machine:

### Choice

- To make a choice, use the vertical bar (also called "pipe").
- To match an a or a b...
  - Regular expression: a|b
  - State machine:

Syntax of Regular Expressions

# Examples

### Some Notational Shortcuts

Expression	(Some) Matches	(Some) Rejects	• A range of o	characters: [Xa-z] matches X and between a and z	
ab*a	aa, aba, abbba	ba, aaba, abaa	(inclusively)	(inclusively).  • Any character at all: .	
(0 1)*	any binary number, $\epsilon$		<ul><li>Any charact</li></ul>		
(0 1)+	any binary number	empty string	• Escape: \		
(0 1)*0	even binary numbers				
(aa)*a	odd number of as		Expression	(Some) Matches	
(aa)*a(aa)* odd number of as			[0-9]+	integers	
(aa bb)*((ab ba)(aa bb)*(ab ba)(aa bb)*)* even number of as and b			X.*Y	anything at all between an X and a Y	
			[0-9]*\.[0-9]*	floating point numbers (positive, without exponents)

Things to know...

Dr. Mattox Beckman (IIT)

Problems I

- They are *greedy*.
  - X.\*Y will match XabaaYaababY entirely, not just XabaaY.

Syntax of Regular Expressions

Syntax of Regular Expressions

- They *cannot count* very well.
  - They can only count as high as you have states in the machine.

Regular Languages

• This regular expression matches some primes:

aa|aaa|aaaaaaaa

- You cannot match an infinite number of primes.
- You cannot match "nested comments". ( $\*\cdot$ \*)

Write a regular expression for the following kinds of words

- hexadecimal numbers
- numbers in scientific notation
- file names ending in .C
- numbers between 0 and 255

Describe in English the following regular expressions

- [a-zA-Z][a-zA-Z0-9]+
- [a-z]\*(es|ed|ing)

Dr. Mattox Beckman (IIT)

• <[a-z0-9]+@[a-z0-9]+(\.[a-z0-9]+)+>

Problems II Answers I

- hexadecimal numbers: [0-9A-Fa-f]+
- numbers in scientific notation: [0-9]+\.[0-9]+E(+|-)[0-9]+

Activity

- file names ending in .C: .\*\.C
- numbers between 0 and 255: 25[0-5]|2[0-4][0-9]|1[0-9][0-9]|[1-9][0-9]|[0-9]
- [a-zA-Z][a-zA-Z0-9]+ like variable names
- [a-z]\*(es|ed|ing) words ending in "es", "ed", or "ing" (verb forms)

Regular Languages

Regular Languages

• <[a-z0-9]+@[a-z0-9]+(\.[a-z0-9]+)+> email addresses

Which of the following can be described by regular expressions?

- All the words in the English language
- All the Fibonacci numbers
- "All Your Base Are Belong To Us" video
- Numbers that are multiples of 4 (assume  $\geq 2$  digits)
- Words that have exactly as many as as they have bs
- Palindromes

Dr. Mattox Beckman (IIT)

Regular Languages

◆□▶ ◆□▶ ◆■▶ ◆■ ● ◆○○○

#### **Answers II**

Dr. Mattox Beckman (IIT)

- All the words in the English language Yes — it's huge, but it works. (a|aardvark|abate|...
- All the Fibonacci numbers No — the set is infinite and requires computation
- "All Your Base Are Belong To Us" video Yes − again, huge, but it works
- Numbers that are multiples of 4 (assume  $\geq 2$  digits) Yes - [0-9]\*([02468][048][13579][26])
- Words that have exactly as many as as they have bs No — requires unbounded counting
- Palindromes No — requires unbounded memory (aibohphobia = fear of palindromes)
